01 / THE PRODUCT

# Make the right connections.

A conference workspace built around what you want to accomplish.

## The problem

Flights, stays, official sessions, side events and speaker profiles live on separate sites. Attendees spend hours researching and still miss useful people and conversations.

## What Conferge does

Conferge brings travel, events and people into one plan shaped by a professional goal. It helps attendees decide who to meet, why they matter and where to spend their limited time.

DEMO SCENARIO

**New York to San Francisco · GitHub Universe 2026**
Fort Mason, October 28-29. A startup founder wants to find a technical cofounder and meet relevant AI builders.

ONE CONNECTED JOURNEY

### 01 Flights

Compare New York to San Francisco options.

### 02 Stays

Compare hotels and Airbnb near the venue.

### 03 Official agenda

Explore sessions and speaker profiles.

### 04 Side events

Find Luma, Partiful and Eventbrite gatherings.

### 05 Connections

Ask who to meet and inspect the evidence.

### 06 Your plan

Build an agenda and map the venues.

**Demo direction:** Show the real interface. The trip is the context; useful professional connections are the outcome.

02 / BRIGHT DATA

# Collect what ordinary requests miss.

Web Unlocker, SERP API and Web Scraper datasets provide the acquisition layer.

Conferge combines direct fetches, Web Unlocker and dataset snapshots to collect from blocked pages and JavaScript-heavy sites. The best method depends on the source.

ACCESS STUDY · 21 SOURCES · OCTOBER 24, 2026

**10 / 21**
Direct access

**14 / 21**
Bright Data

**16 / 21**
Combined methods

REPORTED SOURCE-TEST RESULTS

| Source | Direct access | Bright Data result |
|---|---|---|
| LinkedIn | HTTP 999; Unlocker timed out. | Dataset: 2 snapshot records. |
| Booking.com | HTTP 202 anti-bot challenge. | Unlocker: price content.<br>Dataset: 5 records. |
| Hilton + GitHub API | HTTP 403. | Unlocker: usable content, HTTP 200. |
| Facebook + Google SERP | Incomplete shells. | Unlocker: expected page content. |
| Airbnb | Direct fetch worked; Unlocker returned a shell. | Dataset: 5 records. |

## Keep failures visible

The source study recorded a Luma API timeout, no Google Hotels dataset records and four travel domains blocked by account KYC. These are limitations, not successful collections.

Records retain source URLs, collection times and live/cache/fixture status. Bounded retries and dated caches support recovery; missing data stays unknown.

Figures above are the dated probe results reported in the original brief, not a new benchmark or the current total dataset. Proposed comparisons against Claude and ChatGPT remain unmeasured.

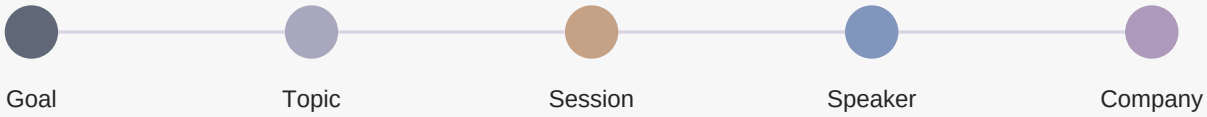
03 / FALKORDB

# Explain the connection.

The graph links goals, topics, sessions, people, companies and places.

A directory gives you names. Conferge uses multi-hop graph queries to connect those names to your goals, then returns the path and source evidence behind a recommendation.

EXAMPLE EVIDENCE PATH



## Explainable recommendations

Bounded Cypher traversals connect a goal to a relevant speaker or host. Each relationship retains its source, confidence and verification. A graph path is evidence of relevance, not proof of a personal relationship.

## Evidence-aware scoring

Repeated paths from the same original source count as one source of evidence. Independent sources can strengthen a recommendation through provenance-aware scoring.

## Enrichment that can be checked

An earlier Bright Data LinkedIn probe matched 9 profiles, added 8 WORKS_AT relationships and 2 Company nodes. That specific probe did not change the top-five ranking.

LIVE REPLANNING DEMONSTRATION

**Recommend → simulate a sold-out event → inspect affected connections → replan.**

The event change is simulated. The graph queries, alternative lookup and application response run for real.

Show the original event, the affected people, a connected alternative and the updated agenda. Keep source links and fixture/cache labels visible. Use real counts and measured timings only.

04 / TRUEFORGE + OPENAI

# Ask. Retrieve. Explain.

The deployed Connections search now runs through TrueForge’s agent runtime.

## 1. Ask

The attendee enters a question and optional company, role or topic filters.

## 2. Retrieve

TrueForge runs an OpenAI model that calls the search_connections MCP tool. OpenAI embeddings and FalkorDB retrieve relevant profiles.

## 3. Check evidence

The agent calls explain_connection to inspect a goal-to-person graph path. A third tool lists available filters.

## 4. Explain

OpenAI summarizes the evidence. Conferge checks returned identities against the original filters and displays canonical profiles and photos.

**What is running:** TrueForge coordinates model and tool calls; Postgres stores sessions and Redis supports runtime coordination. The runtime and MCP server stay private behind the public application.

**Scope:** Read-only MCP tools and recorded tool traces are in use. Sandbox execution, extra skills and approval prompts are not used by this workflow.

PRESENTATION SEQUENCE

**Start with the product.** Ask a networking question and show the results.
**Show acquisition evidence.** Use the dated Bright Data source-test results.
**Show graph reasoning.** Inspect a match, then demonstrate a simulated replan.
**Show the agent trace.** Point to the completed search and evidence tool calls.

Judging focus: hard-to-get data · data quality · usefulness · working demo
